UniFix

Campus maintenance reporting & tracking

Admin-side flow: how a reported issue gets resolved

A walkthrough of what a facilities admin sees and does, from the moment a student reports a problem to the moment it is confirmed fixed.

4

Status states

Reported → In progress → Resolved, with a Reopened loop

1

Admin app

Overview • Triage queue • All issues • Profile

100%

Audited

Every change writes a timestamped history entry

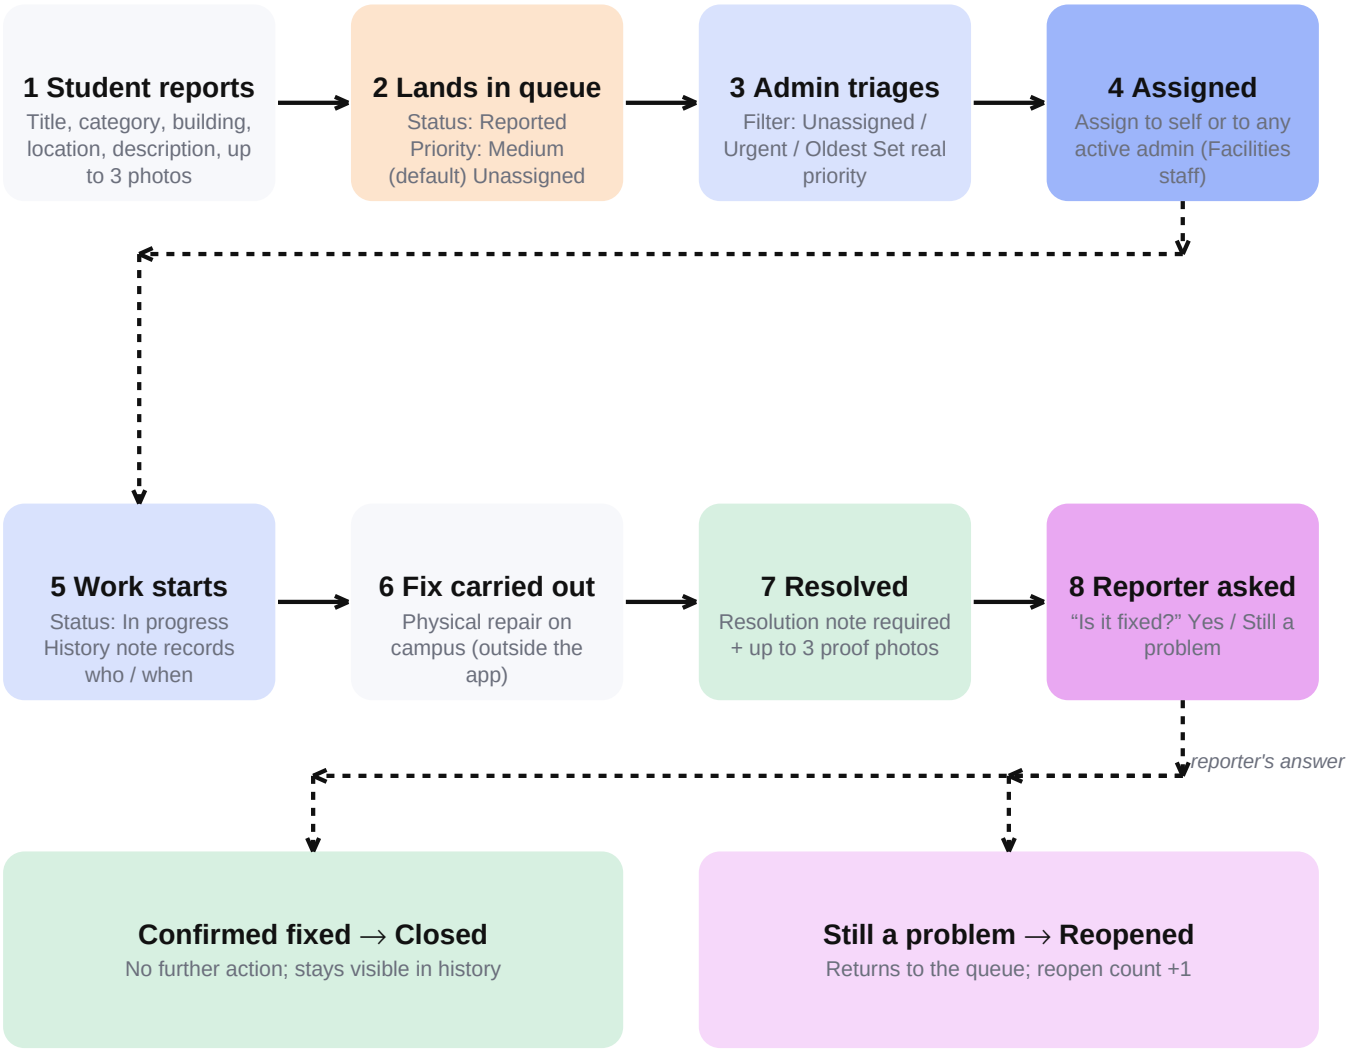
Status colours used throughout this document

Reported | In progress | Resolved | Reopened | Urgent priority

Reflects the shipped admin app and REST API (docs/API.md) — not a mock-up.

END-TO-END

The journey of one report

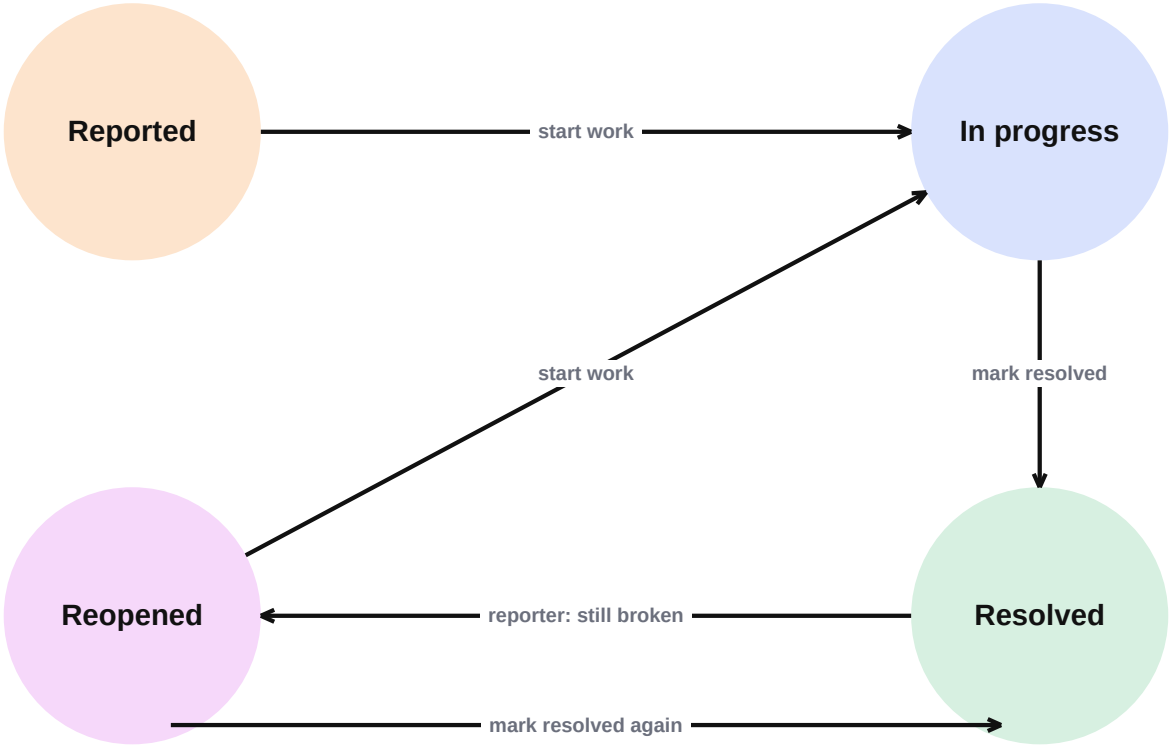


A reopened issue goes back to the queue (step 3) — an admin can move it straight to In progress or Resolved again. See page 3 for every allowed status change.

RULES

Status state machine

Only an admin can change status or priority. The API rejects any move not shown below.



Allowed transitions (enforced by the server, not just the app)

From	To	What the admin does
Reported	In progress	Admin starts work
In progress	Resolved	Admin provides a resolution note; photos optional
Resolved	Reopened	Reporter says the problem still exists
Reopened	In progress	Admin resumes work
Reopened	Resolved	Admin confirms it is fixed, with a new note

Resolved cannot go straight back to Reported, and Reported cannot skip to Resolved — every other combination is rejected (422).

IN THE APP

What the admin actually sees

Overview tab

The first screen after sign-in.

- Open issues (big number) + how many came in since yesterday
- Issues fixed this week, as a ring with the count
- Urgent and Unassigned tiles — tap either to jump straight into a pre-filtered queue
- Average resolution time (e.g. “2.4d”)
- Open issues by category, as horizontal bars, to see where problems cluster

Triage queue tab

Where admins pick up the next open issue.

- Filters: Unassigned (default), Urgent (with a live count badge), Oldest first
- Search by title, building, or report code (e.g. FMC-0483)
- Each card shows priority colour, code, age, title, location and a one-tap Assign button

Issue details + Update issue sheet

Opened from any card; this is where state actually changes.

- Full report: photos, description, location, reporter, and the complete history timeline
- Status buttons show only the transitions currently allowed (see page 3)
- Priority selector (Low / Medium / High / Urgent) and “Assign to” list of active admins
- “Save changes” applies only what was actually changed, and records who did it

Mark resolved screen

A dedicated step before an issue can close.

- A short note describing what was done is required (shown to the reporter)
- Up to 3 “proof of repair” photos can be attached
- Confirms the reporter will be asked whether the fix actually worked

WHY IT'S RELIABLE

Data integrity & roles

Guardrails behind every admin action

One database transaction

Every status, priority or assignment change is written together with its history entry. If either part fails, neither is saved — the issue and its audit trail never disagree.

Stale-change protection

If two admins act on the same issue at once, the server detects the mismatch and rejects the second write (409) rather than silently overwriting it.

Resolution requires proof

An issue cannot become Resolved without a note describing the fix; the server enforces this, not just the app.

Role-checked on the server

Status, priority, and assignment changes are rejected for any non-admin account, even if a request is sent directly to the API.

Full audit trail

Every change — reported, assigned, priority set, status changed, reopened — is stored as a timestamped, named entry and shown on the issue's History timeline.

Who can do what

Student (reporter)	Create reports, view the campus feed and their own reports, answer “is it fixed?” on their resolved reports.
Facilities admin	Everything a student can, plus: triage, assign, change priority/status, resolve with proof, view dashboard stats.
